

SAP GUI T-Codes vs Fiori Apps — Reconciliation

Every T-code and custom Z-transaction from your training screenshots, matched against the KGPL Custom Apps and KGPL Standard Apps already assigned in your Fiori Launchpad — to show which ones a Fiori app already covers, which are close-but-not-exact, and which still have no Fiori equivalent at all. Generated 25 Aug 2026.

How to read the Match column: **FULL** — the Fiori app does the same job end-to-end, no reason to keep using the T-code. **CLOSE** — the Fiori app covers the core function but scope/fields may differ; worth a side-by-side check before retiring the T-code for that team. **PARTIAL** — the Fiori app covers part of what the T-code does; the rest still needs GUI. **GAP** — no Fiori app currently assigned for this at all.

1. Standard SAP T-codes

T-code	Function	Fiori app	Match
VA01	Create Sales Order	Manage Sales Orders	FULL
VF01	Create Billing Document	Create Billing Documents	FULL
VF02	Change Billing Document	Manage Billing Documents	FULL
CA01	Create Routing	Create Routing	FULL
CS01	Create Material BOM	Create Bill of Material	FULL
MSC1N	Create Batch	Manage Batches	CLOSE
MM02	Change Material	Manage Product Master Data	CLOSE
CO01	Create Production Order	— none assigned —	GAP
SM30	Generic table maintenance (any customizing table)	No general equivalent — see Section 3 for the 3 specific tables that already have one	PARTIAL

MM02 and MSC1N are marked CLOSE rather than FULL because the classic transactions expose every material/batch view and customizing screen, while the Fiori apps cover the views your team actually uses day to day — worth one side-by-side check per team before treating them as a full replacement. CO01 (Create Production Order) has no Fiori app in your current KGPL Standard Apps catalog — SAP ships "Manage Production Orders" / "Schedule Production Orders" for this, but neither is assigned yet.

2. Custom Z-transactions

Function column is based on the actual screen captured in your training screenshots (title bar + fields), not just the technical name.

Z-T-code	Function (confirmed from screenshot)	Fiori app	Match
ZDSP_CORR	“Solsynch: Dispatch correction program” — corrects packing list / sales doc sync	Dispatch Correction	FULL
ZEINV	E-Invoice and E-Way Bill Cockpit — registration, cancellation, audit log, update	E-Invoice/E-Way Bill	FULL
ZMERGE	SM30 on the “PP: Merge Master” table (Order/Batch/Dyeing Shade/Quantity)	Merge Details	FULL
ZPACK01	“Create: Packing Details” — header, packing type, paper tube, box weights, Post/Print	Packing Details	FULL
ZPLIST01	“Sales: Create Packing List” by sales document	Packing List	FULL
ZPLIST01A / ZPLIST02A	“Sales: Change Packing List” (two selection variants of the same change function)	Packing List	FULL
ZPOST01	“Posting: Packing and GR” — select open packing/box, Post	Post Packing & GR	FULL
ZTRUCK	SM30 “Truck Master” table — Transport Code + Truck No. columns	Truck Master, Transport Code	FULL
ZSDOBDN	“Sales: OBD Automation” — Save OBD from packing list + truck/transporter/incoterms	Post Goods Movement — ADT-verified: no field match	GAP
ZSOREG	“Sales: Order Register” — ALV list of sales orders by org/division/agent/material, Open/Close/Both	Sales Register — ADT-verified: billing side only	PARTIAL
ZBILLGP	“Billing Gate pass” — print/reprint gate pass by billing document range	Gate Pass apps — ADT-verified: no billing link	PARTIAL
ZINVCN	“Commercial Invoice Print” by billing type/document/date (POY & FDY divisions)	Export Details	PARTIAL
ZDEL	“Display Outbound Delivery” — generic lookup by OBD, inbound delivery, or material document	Inbound Delivery (inbound side only)	PARTIAL

3. Generic SM30 access already closed by custom apps

SM30 itself has no Fiori replacement in general — it's a generic table editor for any customizing table. But for the specific tables your team maintains through it, a purpose-built Fiori app already exists:

SM30 table	Fiori app	Match
ZPP_SHADE	Shade Master	FULL
PP: Merge Master	Merge Details	FULL
Truck Master (Trpt Code + Truck No.)	Truck Master, Transport Code	FULL

4. Gaps and recommended next steps

Item	Status	Recommended action
CO01 — Create Production Order	No Fiori app assigned yet (not ADT-checked)	Add SAP-standard “Manage Production Orders” / “Schedule Production Orders” to the KGPL Standard Apps catalog — no custom development needed, just a catalog/role assignment.
ZSDOBDN — OBD Automation	ADT-confirmed gap — see Section 5	ZCL_OBD_AUTOMATION (the live custom OBD class) only does pre-dispatch validation and 621 packing-material consumption; it explicitly leaves delivery creation and goods issue on standard VL01N. No Z object in ZKGPL_FIORI captures Truck Number / Transporter Code / Incoterms / GR Slip. Needs either a new custom Fiori app for the OBD-save step, or a documented decision to keep ZSDOBDN for that step.
ZSOREG — Sales Order Register	ADT-confirmed partial — see Section 5	ZI_SALES_REGISTER's own source comment says it replaces only “the sales side” of ZSOREG. Division, Agent, and the Open/Close/Both order-status filter are not in the view. A dedicated worklist app (or an extension of this CDS view) is needed to fully retire ZSOREG.
ZBILLGP — Billing Gate Pass print	ADT-confirmed partial — see Section 5	The Gate Pass CDS views (ZC_GTPASS, ZI_GATEPASS_REGISTER) track vehicle in/out by plant and department only — no billing document field, no print/reprint action. ZBILLGP's specific function isn't covered; would need a billing-document-linked action added to the Gate Pass app, or a small dedicated print app.
ZINVCN — Commercial Invoice Print	ADT-confirmed partial — see Section 5	ZI_EXPORT_DETAIL exposes only Billing Document / Condition Type / Net Value / Currency / Exchange Rate / Billing Date — no Billing Type or POY/FDY division fields, and it's read-only (no print/generate action).
ZDEL — Display Outbound/Inbound Delivery	ADT-confirmed partial — see Section 5	ZI_HU_INBOUND's own source comment says it replaces ZSOL_INBOUND_HU / ZHUINB, not ZDEL, and its scope is HU-level goods-receipt posting — not the generic outbound/inbound/material-document display ZDEL performs.

5. ADT verification — live backend check (25 Aug 2026)

The five CLOSE/PARTIAL matches this report originally flagged as "needs team verification" were checked directly against the live KSD backend via ABAP Development Tools (ADT) — reading the actual CDS view, service, and class source behind each Fiori app, not just its tile name. Two verdicts changed as a result.

Item	Original	Revised	ADT evidence
ZSDOB DN	CLOSE	GAP	ZCL_OBD_AUTOMATION (live, package ZKGPL_FIORI) — its own header comment: outbound-delivery creation, HU packing and goods issue "stays on the STANDARD delivery transaction... a raw-BAPI rebuild is high-risk." Its two methods (validate, consume_packing_materials) never reference truck, transporter, incoterms, or GR-slip fields. A search of the ZKGPL_FIORI namespace for OBD/transport-related objects found only ZC_TRANSPORT (a transporter master table app, already counted under ZTRUCK) and ZUI_HU_GOODS_MOVEMENT, whose only fields are Material/Batch/Quantity/Unit/Plant/Storage Location.
ZSORE G	CLOSE	PARTIAL	ZI_SALES_REGISTER source comment (verbatim): "Replaces ZSALES..., ZSALESN..., ZSALESB and the sales side of ZSOREG (order register)." The view is a billing-cube over VBRK/VBRP with no Division, no Agent, and no order-status field — the Open/Close/Both filter ZSOREG's screen showed has no equivalent here.
ZBILLG P	CLOSE	PARTIAL	ZC_GTPASS (Gate Pass Header) and ZI_GATEPASS_REGISTER both carry GpNumber/Plant/Department/Vehicle Number/In-Out date-time — a physical vehicle log. Neither exposes a billing document field or a print/reprint action, which is the entire function ZBILLGP performs.
ZINVCN	PARTIAL	PARTIAL (confirmed)	ZI_EXPORT_DETAIL (RAP-managed, table ZEXP) exposes only Billing Document, Condition Type, Net Value, Currency, Exchange Rate, Billing Date — no Billing Type, no POY/FDY division, and no print/generate action. Original PARTIAL rating confirmed accurate.
ZDEL	PARTIAL	PARTIAL (confirmed, scope corrected)	ZI_HU_INBOUND source comment: "replaces ZSOL_INBOUND_HU / ZHUINB" — not ZDEL. Its scope is a postInboundGr action for handling-unit goods receipt, not the generic outbound/inbound/material-document lookup ZDEL provides. Original PARTIAL rating confirmed, but the underlying app is narrower and differently purposed than assumed.

Methodology: functions were read directly off the SAP GUI screen titles and field labels captured in your training screenshots (Archive.zip), not assumed from the transaction code alone. Fiori app names are taken from the KGPL Custom Apps and KGPL Standard Apps categories currently visible in your KSQ "All My Apps" menu. The five items above were additionally verified against live ADT source (CDS views, service definitions, and class implementations in package ZKGPL_FIORI) on 25 Aug 2026 — those verdicts are confirmed, not hypotheses. MSC1N, MM02, and CO01 in Section 1 were not ADT-checked and remain starting hypotheses to verify with the team that actually uses each transaction.
